News: [Despite The Internet, Google Generation Lacks Analytical Skills](#) (Jan. 08 study)

Excerpt:

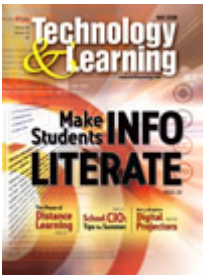

“While research into how young people become competent in using the Web is patchy, the study did find some consistent themes. For one, information literacy has not improved with the widening access to technology. Instead, the speed of Web searching means little time is spent evaluating information for relevance, accuracy, or authority. Young people also have difficulty in developing an effective search strategy. As a result, they have a strong preference for using natural language in searching, rather than analyzing which keywords

might be more effective. When searching brings back a long list of results, young people have difficulty assessing the relevance of the materials, and often print out pages with no more than a glance at them.
“

“While media literacy and information literacy have developed as separate traditions, they share many of the same values. In general, the “media literacy” tradition stresses the understanding, comprehension, critique and creation of media materials, whereas the “information literacy” tradition stresses the identification, location, evaluation and use of media materials. Metaphorically, we might say that “media literacy” sees media as a lens through which to view the world and express oneself, while “information literacy” sees information as a tool with which to act on the world. Both perspectives are relevant for developing media literacy policy.”

Livingstone, S., Van Couvering, E., & Thumim, N. (2005). p12 Adult media literacy: A review of the research literature. London: Ofcom.)
